introductions in 2003 [Acute pancreatitis with hyperamylasaemia and normal amylase--an atypical manifestation?]. A case of acute pancreatitis with hyperamylasaemia and normal amylase is reported. The mechanism of hyperamylasaemia in this disorder is unclear. It is considered as an atypical manifestation of the disease or in connection with a lesion in the pancreas. As demonstrated by many authors, there is a

considerable overlap in signs and symptoms of acute pancreatitis and hyperamylasaemia. A high clinical suspicion is therefore necessary for early diagnosis of this condition.

C2-Functionalized Novel Iridium(III) Complexes: Structural and Photophysical Characteristics.

The synthesis, structural characterization, and photophysical properties of a series of C2-functionalized novel iridium(III) complexes $\text{Ir}(m)(\text{C2P})_3$ ($m = 0-3$) (C2P = cyclo-2-(2-pyridyl)pyridinato) are

reported. These complexes are stable for 2 years in air and exhibit a direct, square-planar, octahedral structure. Strong transitions are observed in the NIR region (770-1100 nm). The length of the substituent C2 increases from 0 to 3, resulting in a bathochromic shift in the absorption from 1277 nm ($m = 0$) to 1116 nm ($m = 3$)
